The Teacher: Lita is a homeschool parent, currently working in operations and curriculum development for a private online school based in CA, but has also been a teacher, math trainer, curriculum vendor, school administrator, as well as an educational/school startup consultant, and has been deeply involved in online learning since 1998. In 2007, she discovered she had a talent and a passion for instructional design, operations and systems support and has enjoyed developing her skills in those areas since then. She is a tech enthusiast, loves all things e-learning, and enjoys exploring and learning about new applications and tools and passing those skills on to others every chance she gets.

The Course: Navigating technology and the internet can be daunting for students and scary for parents. It's important to give students tools that enable them to be successful in a tech-driven culture, where they can confidently emerge as the Christian leaders and entrepreneurs of tomorrow. We will explore everything from basic computer use, to internet safety and many tools available to “create” on the computer. The course includes practical use and applications of technology, and assignments are project based to allow students the opportunity to practice. Students spend the year building a final “showcase” which enables them to apply and demonstrate all that they learn.

“Computing is not about computers anymore. It is about Living.” Nicholas Negroponte
